Hi Justus,

Looks like my team's availability is a bit limited this week. But they did provide answers to your questions.

1. What is the byte order of the fields in the NCS protocol header? The serial comm to the pumps are specified as LSB, but the network header doesn't specify.

The network protocol packet is little-endian. So:

byte[0]=LSB of command code

byte[1]=MSB of command code

byte[2]=LSB of data size

byte[3]=MSB of data size

2. The response header's size field doesn't have a description in the spec. I'm assuming it follows the same convention as the command header, being the size of the entire packet including the header, would that be correct?

Yes, the response data size is the size of the entire message, including the header. So, for network packet, data size = payload size + 18 (header size); serial packet is payload size + 6 (4-byte header + 2-byte CRC).

Already answered the logical value of each COM port.

Entegris does not have code snippets to provide. Let us know what you need help with and then let's see if we can have a quick chat with the Engineering team or if they can provide some pseudo code.
